An SFI® managed forest is a Sustainable forest.

Managed lands are made up of sections of trees organized by age. Only one section is cut at a time, the most mature of the group. That section is then planted with seedlings to replace harvested trees to continue the growing cycle.

Well-planned landscapes and managed forests are the principal method to preserving biodiversity, ecosystem health, and human well-being.

USDA label assures that the product contains renewable biological ingredients.

- Derived from plants and other renewable agricultural, marine, and forestry materials.
- Provide an alternative to conventional petroleum derived products.
- Products do not include food, animal feed, or fuel.

The program’s purpose is to spur economic development, create new jobs and provide new markets for farm commodities. The increased development, purchase, and use of biobased products reduces our nation’s reliance on petroleum, increases the use of renewable agricultural resources, and contributes to reducing adverse environmental and health impacts.
